B.TECH.

Theory Examination (Semester-II) 2015-16

ENGINEERING MECHANICS

Time : 3 Hours

Max. Marks : 100

Section-A

Q1. Attempt all. Each question carries equal marks.

(2×10=20)

- (a) Define Lami's theorem and state its applications.
- (b) State coloumb law of forces.
- (c) State the assumptions made in the analysis of pin jointed trusses.
- (d) What do you mean by point of contraflexure in beams.
- (e) Differentiate between centroid and Centre of gravity.
- (f) Define Radius of gyration.
- (g) What is general planar motion?

- (h) State D' Alembert's principle.
- (i) Define Hooke's law and Modulus of rigidity.
- (j) Differentiate between bending moment and moment of resistance.

Section-B

Q2. Attempt any five parts.

(10×5=50)

- (a) Prove that belt tension ratio. $T_1/T_2 = e^{\mu\theta}$ where T_1 is the tight side and T_2 is the slack side.
- (b) A man climbs on a 5 m long ladder. makes an angle of 60° from the horizontal. The other end of the ladder is supported on a vertical wall. The coefficient of friction between the ladder and wall is 0.2 and between the ladder and floor is 0.3. The weight of ladder and man are 150 N and 800 N. How far can the man climb on the ladder?
- (c) Find reactions at the support for the given beam as shown in fig 1.
- (d) Determine the forces in all the members of the truss structure shown in fig 2.
- (e) Derive the expression of mass moment of inertia for spherical body.
- (f) Calculate the centroid for the LINE segment as shown in the fig 3.

- (g) A cylindrical roller, 50cm in diameter, is in contact with two horizontal conveyor belts running at uniform speed of 5m/s and 3 m/s as shown in figure4. Assuming that there is no slip at points of contact, determine (a) position of the instantaneous center of roller. (b) Linear velocity of the center. (c) Angular velocity of roller. (d) How these parameters would be affected if the velocities of the belts are in opposite direction refer fig 4.
- (h) State the assumptions made in the theory of pure tor-

sion. Derive the torsion formula $\frac{T}{J} = \frac{G\theta}{L} = \frac{\tau}{R}$.

Section-C

Attempt any TWO. Each question carries equal marks.

(2×15=30)

- Q3. Draw the shear force and bending moment diagrams for the simple supported beam as shown in fig 5, and also find the point of contra flexure.
- Q4. Find the moment of inertia about the centroidal axis and also polar moment of inertia for the section shown in fig 6.
- Q5. State the assumptions made in the theory of pure bending, derive the relationship for pure bending $\frac{M}{I} = \frac{\sigma}{Y} = \frac{E}{R}$ and also find the neutral axis location.
